EXPERIMENT 15

CAREER PATHWAYS AND FUTURE OF LOW-CODE

Student Name: Ajayshankar Giridharan Roll Number: 21401007

1. Aim

To examine career pathways related to low-code development and summarize future trends that influence application development practice.

2. Objectives

• Identify foundational skills for a low-code developer.
• Map progression from app builder to solution developer and fusion team engineer.
• Understand the continuing role of pro-code, APIs, testing, and governance.
• Summarize likely future directions of low-code development.

3. Platform and Application Context

Platform: Zoho Creator
Application: Loan Application & Pre-Screening Management
Form: Loan_Application_Form
Report: Loan_Application_Report
Student Roll No.: 21401007

4. Theory

Low-code career paths combine business process understanding with data modelling, visual application building, automation, integration, testing, and governance. As solutions become more complex, professionals benefit from Deluge or equivalent scripting, API concepts, version/deployment practices, security, and a general-purpose programming language. AI assistance can accelerate routine tasks but does not remove the need for verification, architecture, privacy, and testing.

5. Procedure

1. Review the existing experiments: forms, reports, dashboards, Deluge workflows, API connection, role permissions, and Zia Build Agent.
2. Map these practical skills to entry-level low-code developer responsibilities.
3. Identify additional skills for a solution developer: API design, scripting, security, testing, deployment, and troubleshooting.
4. Review future trends such as AI-assisted building, reusable components, integration-first architecture, and governance-by-design.
5. Prepare a personal learning plan based on the gaps identified.

6. Observations / Test Results

Area	Observation	Status / limitation
Foundation	Forms, reports, fields, data modelling, workflow logic.	Demonstrated across earlier app experiments.
Intermediate	Deluge, dashboards, connections, API concepts, access control.	Several components documented; some live integration/access tests remain pending.
Advanced / hybrid	External functions, serverless services, deployment lifecycle, testing and observability.	Recommended next skills; not all were implemented in this lab.
Future trend	AI-assisted development with human review; stronger governance and hybrid low-code/pro-code delivery.	Direction discussed conceptually; no forecast is presented as a measured certainty.

7. Result

The experiment maps low-code skills to potential career progression and identifies practical next steps toward hybrid solution development.

8. Conclusion

Low-code roles are strongest when combined with sound software engineering practice: requirements analysis, testing, security, integrations, documentation, and lifecycle management. AI can assist development, but developers remain responsible for correctness and governance.

Suggested personal learning plan

1. Strengthen form/report/data modelling skills.
2. Practise Deluge validation, debugging, and reusable functions.
3. Learn REST APIs, JSON, authentication, and safe connection management.
4. Practise deployment checklists, access reviews, and test documentation.
5. Build one small, clearly documented pro-code extension in a development environment.

9. Evidence

The figure below is a generated explanatory schematic based on the documented experiment context. It is clearly labeled illustrative and is not a captured screenshot of a live deployment or a claim that untested actions succeeded.

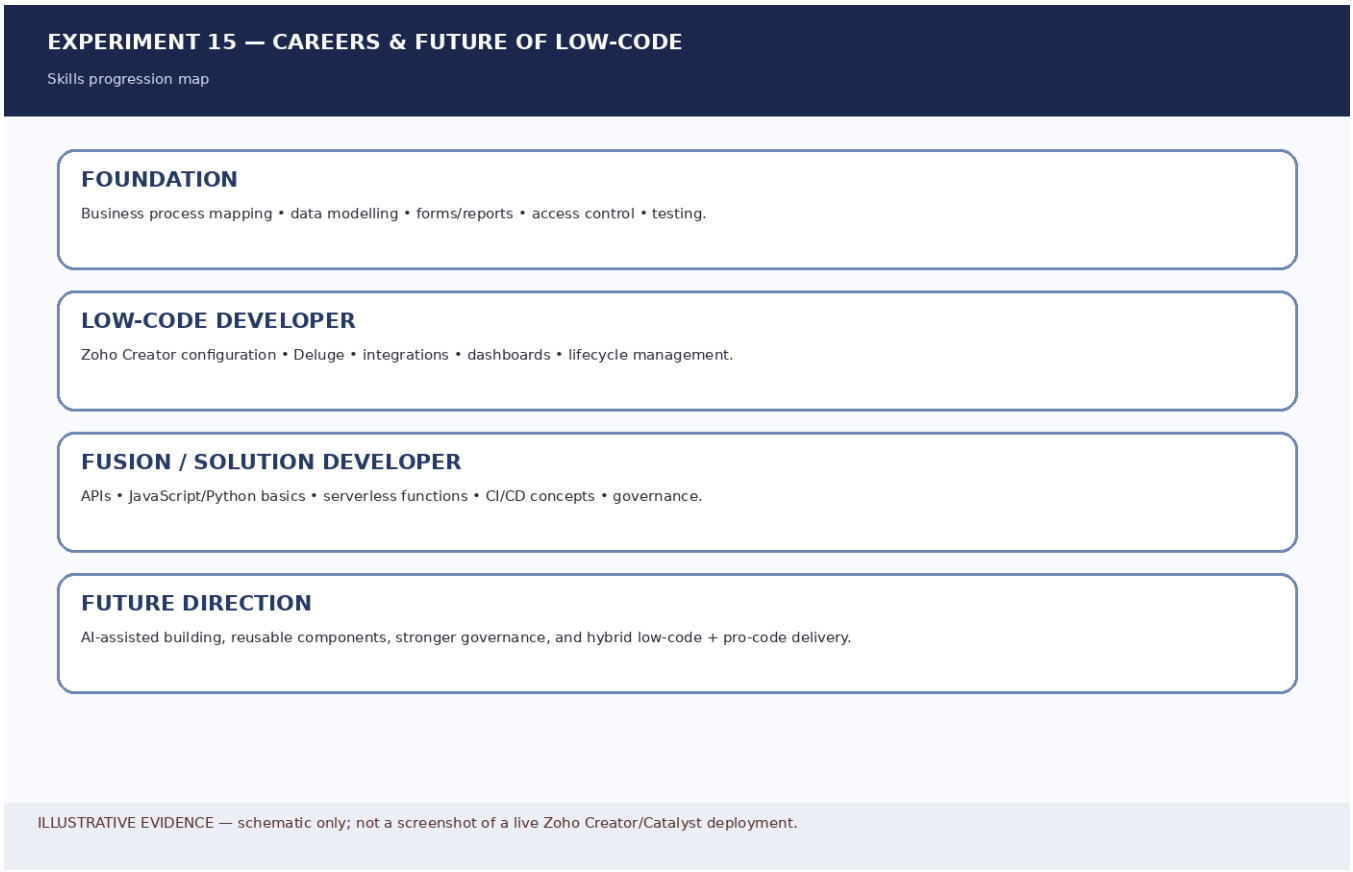

Figure 15.1 — Illustrative skills progression map for low-code career development.

Submission note: Where the experiment requires live configuration evidence, replace or supplement this schematic with your own screenshot from Zoho Creator/Catalyst after completing the corresponding step. Do not submit the schematic as a real system screenshot.
