Automated Workflow & Deluge Scripting - Zoho Creator Lab Record

Building Reports, Dashboards, and Custom Pages (UI Builder) for the Application Automated Business Workflow using Deluge Scripting - Loan Application Form

Student Name : Ajayshankar Giridharan
Register Number: 241401007

241401007

1. Aim

To design and implement an automated business process workflow within the Zoho Creator application using Deluge scripting, and to successfully conduct application testing and debugging to verify real-time execution, using the **Loan Application** form.

Objectives

- To configure a form-level event trigger that automatically executes actions upon a successful record creation for the **Loan Application** form.
- To write custom backend logic using Deluge syntax to send automated email confirmations to the applicant once their loan application is submitted.
- To perform end-to-end debugging and live testing to ensure data accuracy and workflow reliability.

2. Procedure

Step 1: Initiating the Workflow

1. Open the **Loan Application** application in Edit mode within Zoho Creator.
2. Navigate to the left-hand navigation panel and select the **Workflows** tab under the Configuration section.
3. Click on the blue **Create New Workflow** button in the top right corner to open the automation setup modal window.

Step 2: Defining the Trigger Parameters

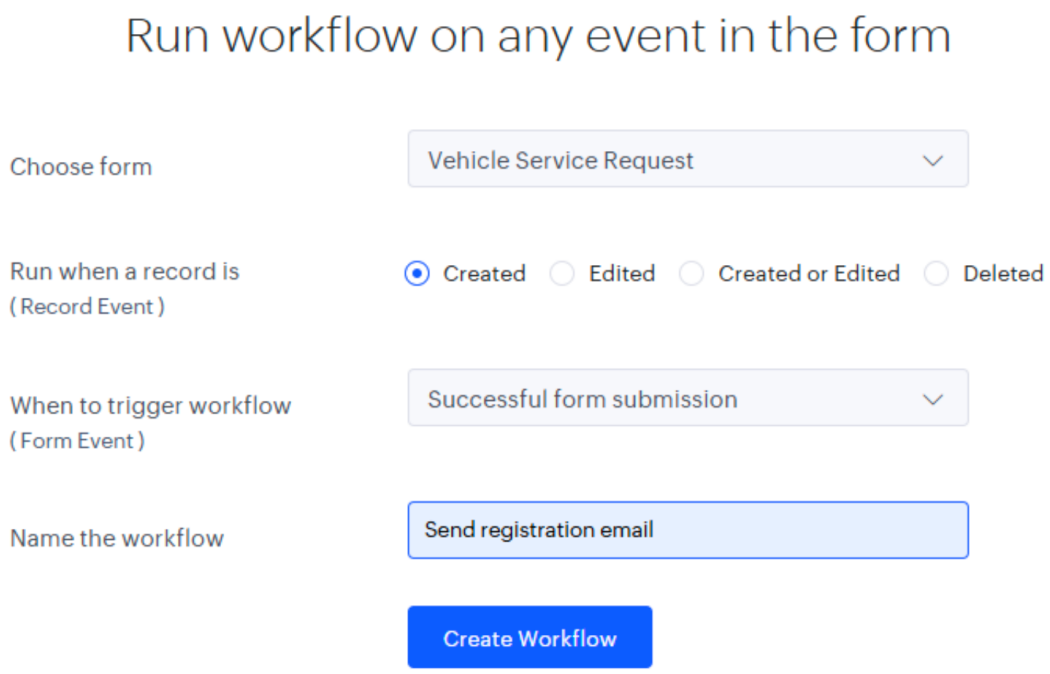

1. Under the **Choose form** dropdown menu, select the target form: **Loan Application**.

2. Under the **Run when a record is (Record Event)** condition, select the radio button for **Created** to ensure the automation executes exclusively for new entries.

3. Under the **When to trigger workflow (Form Event)** dropdown, select **Successful form submission** to execute backend logic post-validation.

4. In the **Name the workflow** text box, enter: Send Loan Registration Email.

5. Click the **Create Workflow** button to generate the execution pipeline block.

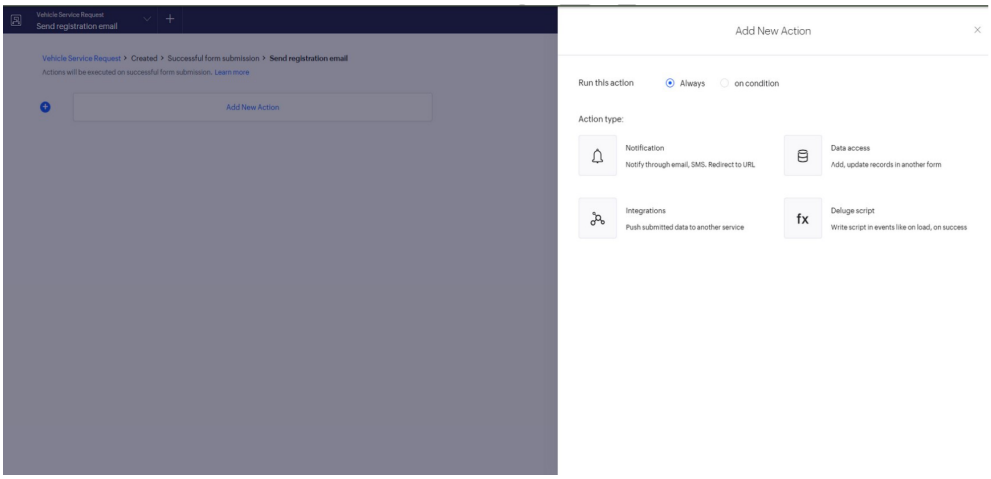

Step 3: Setting up the Action Interface

1. Inside the workflow diagram interface, click the **Add New Action** button under the workflow trigger block.

2. Set the execution rule to **Always** (Run this action: Always).

3. Under the **Action Type** grid, locate and select **Deluge script** (represented by the fx symbol) to launch the integrated cloud IDE workspace.

Add New Action Panel showing action types (Notification, Data access, Integrations, Deluge script) set to run 'Always'

Step 4: Developing the Deluge Script

1. Access the open Deluge Script editor window.

2. Query the active database record using its system ID parameter (input.ID) to extract the applicant details.

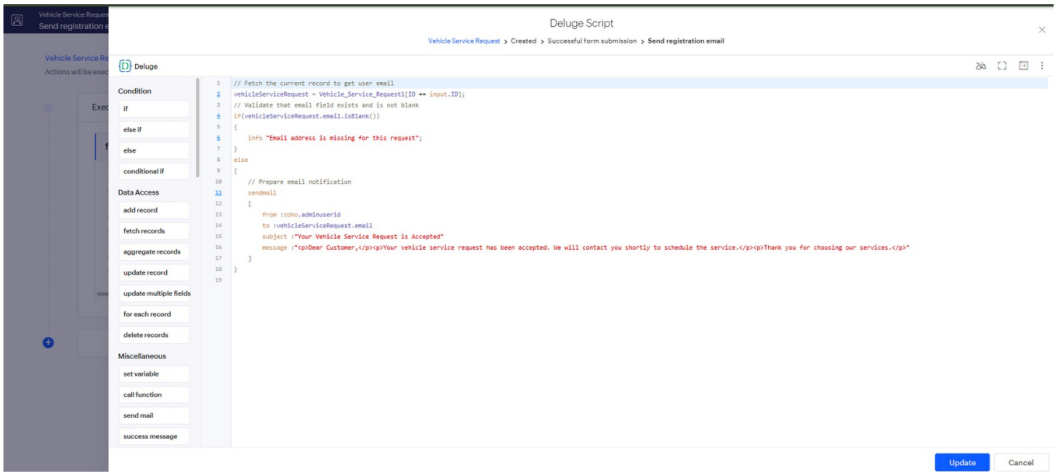

3. Construct a conditional statement (if...else) evaluating whether the email field is blank using the .isBlank() method.

4. Inside the valid path, construct a sendmail block with the system variable zoho.adminuserid as sender, mapping the recipient (to:) dynamically to loanApplication.email.

5. Format the HTML payload string to deliver a professional application receipt message.

The finalized Deluge script used in this workflow is reproduced below:

24140107

OUTPUT :

24140107

```
// Fetch the current record to get user email
loanApplication = Loan_Application1[ID == input.ID];
// Validate that email field exists and is not blank
if(loanApplication.email.isBlank())
{
   info "Email address is missing for this request";
}
else
{
   // Prepare email notification
   sendmail
   [
      from :zoho.adminuserid
      to :loanApplication.email
      subject :"Your Loan Application is Received"
      message :"<p>Dear Applicant,</p><p>Your loan application has been successfully submitted and accepted for processing. We will contact you shortly regarding the next steps.</p><p>Thank you for choosing our services.</p>"
```

```
  ]
}
```
